SUMMARY

Backend and platform engineer with 10+ years designing distributed systems for fintech, mobility, and e-commerce, now building the AI platform and agent infrastructure other engineers work on top of. Specializes in high-performance API design, event-driven architecture, and cloud infrastructure on AWS, with a consistent record of replacing fragile systems with ones that scale. Equally at home owning delivery infrastructure, orchestrating LLM workflows, and driving adoption of new engineering practices org-wide.

SKILLS

Languages & Frameworks: TypeScript, JavaScript, Node.js, ExpressJS, Python, FastAPI
Database & Messaging: PostgreSQL, MySQL, MongoDB, Redis, Kafka, RabbitMQ, BullMQ, NoSQL
Cloud & DevOps: AWS (Lambda, S3, API Gateway, SQS/SNS, Cloudwatch, RDS, EC2, ECS), GCP, Docker, CI/CD, Git
Architecture & APIs: Microservices, Event-driven & Serverless architecture, REST, GraphQL, gRPC
Practices: Agile/Scrum, JIRA, Test-driven development, Code review & mentoring, Agentic Engineering, AI Agents, Workflow Automation

WORK EXPERIENCE

Senior AI Platform Engineer, *FINN* Apr 2026 – Present | Remote

- Architected and shipped an in-house LLM agent platform that autonomously resolves 90% of inbound engineering and business requests, routing across Claude, DeepSeek, and OpenRouter models behind a unified orchestration layer.
- Drove org-wide adoption of AI-assisted development workflows, delivering a 3x increase in engineering throughput from 3.3 to 10.5 merged PRs per developer per week.
- Established automated guardrails, end-to-end test coverage, and CI pipelines across all repositories, holding change failure rate at 5% while release volume tripled.

Senior Software Engineer, *FINN* Apr 2025 – Mar 2026 | Munich, Germany

- Led quarterly release of fleet profitability engine, integrating 5 contributors' changes and coordinating rollout across 3 teams; root-caused a 3-month revenue-reporting defect, closing a ~30% gap in per-unit profit accuracy.
- Rearchitected nightly data pipeline processing 23M+ rows using hash-based change detection, eliminating recurring Lambda timeouts and full-table rewrites.
- Built schema-driven API adopted as company-wide source of truth for vehicle data, raising product configuration coverage from 0% to 100%.
- Partnered with the vehicle operations team to design and ship internal tooling that automated VIN assignment and configuration changes, eliminating a daily manual workflow.
- Owned build and deploy infrastructure for a serverless monorepo, cutting dependency install time 90% via pnpm migration and eliminating recurring CI failures that blocked releases.

Principal Engineer, *Beem* Sep 2022 – Mar 2025 | San Francisco, CA

- Designed and developed a comprehensive personal finance management system, empowering users to effectively monitor and manage their income, expenses, and investments. Incorporated robust security measures to ensure the protection of sensitive user data.
- Architected and implemented a robust and scalable event-driven communication system, empowering efficient delivery of high volumes of SMS, emails, and push notifications to users.
- Discovered and resolved numerous bugs in the dues collection system, leading to a significant 20% boost in dues collection rates.
- Revamped the existing codebase by introducing advanced algorithms and optimised data structures, resulting in remarkable enhancements in performance, speed, and overall efficiency.

Senior Software Engineer, *Zebpay* Sep 2021 – Sep 2022 | Mumbai, India

- Designed and developed in-house Authentication and Authorisation service to replace third-party service (Auth0). This improved the average login time for users (including OTP and pin verification) by 3x and also saved close to $100k annually for the organisation.

- Created a real-time analytics dashboard to monitor various aspects of the app. Built using Kafka streams, ksqlDB, Debezium and Apache Superset.
- Created a membership NFT service in Web3 that could be used by any DAO to reward their members. This project got selected for the ETH Global Hackathon.

Senior Software Engineer, *DMart Ready* Apr 2020 – Sep 2021 | Mumbai, India

- Developed a closed-loop wallet for online and offline stores. Technologies used - NodeJs, Typescript, Express, Jest, PostgreSQL.
- Designed and developed the delivery slot booking system. Replaced existing proprietary IBM software, addressing all its performance issues. Technologies used - NodeJs, Typescript, Express, Jest, MongoDB.

Software Developer, *Reliance Jio Infocomm* May 2018 – Mar 2020 | Mumbai, India

- Built, tested and deployed scalable, highly available and modular API Gateway using Node.js for JioMoney application resulting in 5x increase in TPS.
- Designed and implemented Zero Level Authentication (ZLA) API for seamless user login. ZLA API is consumed for skip sign in feature in Jio Fibre. This removed any user interaction required for login and reduced the login time to just 1-2 seconds**.**
- Implemented API security using various authentication mechanisms, Mutual SSL, Encryption etc and API access control using Rate limiting and throughput Quota.

Assistant System Engineer, *Tata Consultancy Services* Aug 2016 – May 2018 | Hyderabad, India

- Major responsibilities included identifying gaps in the integration process and providing code/configuration fixes, taking proactive measures for quick and efficient resolution of issues.
- Provided RCA and Fixes, which resulted in an increase of E2E integration from 20% in Nov 2016 to 70% in Nov 2017.
- Created a dashboard for proactive monitoring of integration failures which helped in reducing the dependency on the users and gave a consolidated view of all the issues.

EDUCATION

Master of Science in Computer Information Systems, AI Specialization Expected Dec 2027
Indiana Wesleyan University

Bachelor of Engineering, *Mumbai University* May 2016
Major: Information Technology
